

Measurement and Supply of Discs

We supply standardized and customized elements to select and supply discs and compensating elements and to re-measure and acknowledge the selected parts.

The part magazines are available in two versions by default. With the version featuring chutes, the discs are stacked on top of each other. With the version featuring pins, the discs hang on pins. The selected disc is indicated by a flashing lamp on the respective magazine, which is connected to a measuring computer or the control system.

The selected discs are re-measured at acceptance stations with tactile measuring equipment.

There are various models for these acceptance stations. The simple version is equipped with dial gauges, the linked version with inductive probes. Versions with an automated measurement start are also possible.
